21. *November 10, SecurityWeek* – (International) **High severity DoS flaw patched in OpenSSL.** The OpenSSL Project released OpenSSL 1.1.0c resolving three vulnerabilities after a Google security researcher discovered a heap-based buffer overflow associated with Transport Layer Security (TLS) connections using ChaCha20-Poly1305 cipher suites that can lead to a denial-of-service (DoS) condition, which could result in a crash of OpenSSL. The update also addresses a moderate severity flaw that can cause applications to crash, and a low severity issue related to the

Broadwell-specific Montgomery multiplication procedure.
